John McAfee Launches Everykey, New Product that Replaces Passwords and Keys, on Indiegogo

“This is a f••ing game changer” - John McAfee, Founder of McAfee Antivirus

- Everykey now available on Indiegogo for as low as \$75 (\$90 off retail price)
- Everykey can unlock your phone and laptop - it can also automatically log you into your website accounts
- Everykey also works with physical locks, like car doors and house doors
- When Everykey is close to one of your devices, it unlocks that device - then re-locks it when you're out of range

Cleveland, OH – December 7, 2015

Today, John McAfee, founder of McAfee Antivirus and Chief Evangelist of Everykey Inc. (<https://everykey.com>), has announced the launch of an Indiegogo campaign (<https://everykey.com/indiegogo>) to fund production for Everykey, the revolutionary device that replaces all passwords and keys. The campaign will run for approximately one month, beginning today and ending on January 10, 2015.

When Everykey is close to your phone, laptop, tablet, house door, car door, or another access-controlled device, it unlocks that device. When you walk away, that device locks back down. Everykey can also log you into your website accounts. If you lose your Everykey, you can remotely freeze it, so no one else can use it.

“When our team first conceptualized Everykey, security was a top priority,” McAfee comments. “That’s why we’ve built in military grade encryption and safety features like the ability to remotely freeze your Everykey if it’s lost or stolen.”

Everykey also stores a password keychain, which can be used to seamlessly log the user into their website accounts when they are within range of one of their devices.

In addition to the sleek Everykey, users have the option to accessorize with the Band or Key Ring Accessories. The accessory options enable versatility, allowing for Everykey to fit each user’s unique lifestyle.

“When we looked at the access control industry, we saw an outdated and insecure system. We wanted to build something that was more personal and convenient. Instead of carrying a bulky keychain and remembering a list of passwords, we want your access control to be something you don’t have to think about. That was our dream back when this was just a school project, and we’re making it a reality with Everykey!” Everykey CEO Chris Wentz comments.

About Everykey

Everykey began as an innovative project for an entrepreneurship class at Case Western Reserve University in September, 2012. The class professor was so impressed with the concept that he invested his own money into the startup. Future plans include the release of an SDK, which allows other access control technologies to seamlessly integrate with Everykey. This means Everykey could not only unlock, but also start a car, unlock house doors, turn on lights, and even replace credit cards. For more information or to pre-order your Everykey, please visit
